**(54) ELECTROLUMINESCENT PHOSPHOR AND
ORGANIC DISPERSION-TYPE
ELECTROLUMINESCENT ELEMENT**

(57) Abstract:

PROBLEM TO BE SOLVED: To obtain an electroluminescent phosphor emitting blue light and having good luminance and life characteristics; and an organic dispersion-type electroluminescent element using the same.

SOLUTION: A blue pigment is attached to the surfaces of electroluminescent phosphor particles comprising zinc sulfide as a base material, copper as an activator, and at least one element selected from among chlorine, bromine, iodine, and aluminum as a coactivator. Thus treated electroluminescent phosphor is dispersed in a dielectric to form a luminescent layer of an organic dispersion-type electroluminescent element.
